Figure 10.10: The structure of the human eye.

1. The cornea is the front part of the eye that helps to focus light.

2. The iris is the colored part of the eye that controls the amount of light entering.

3. The pupil is the opening in the center of the iris through which light passes.

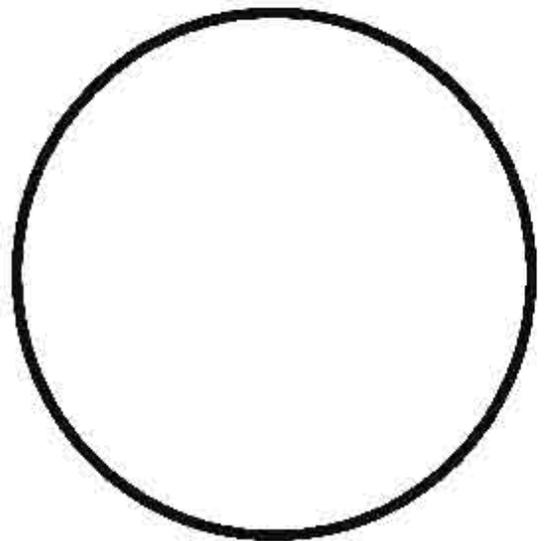

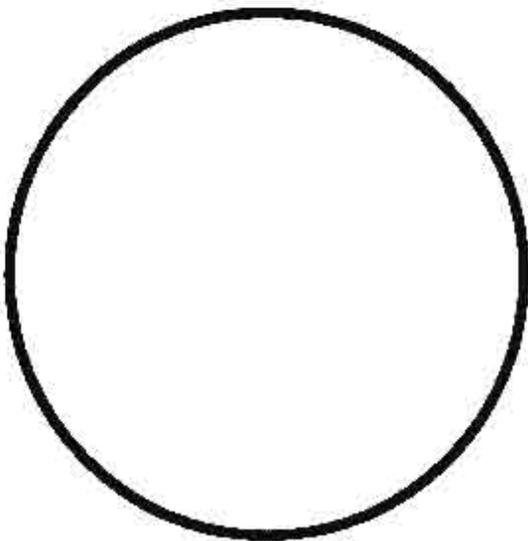

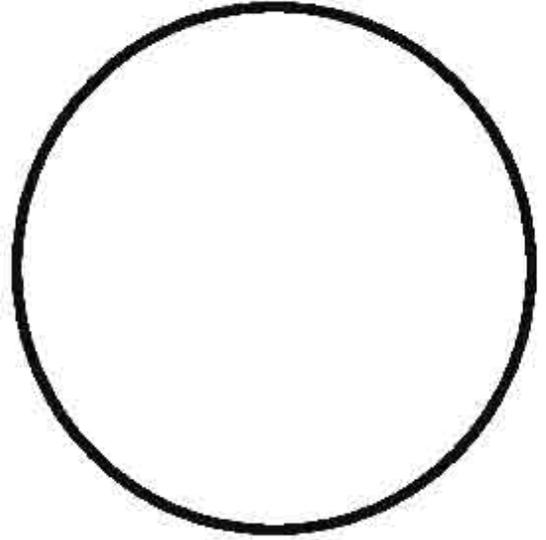

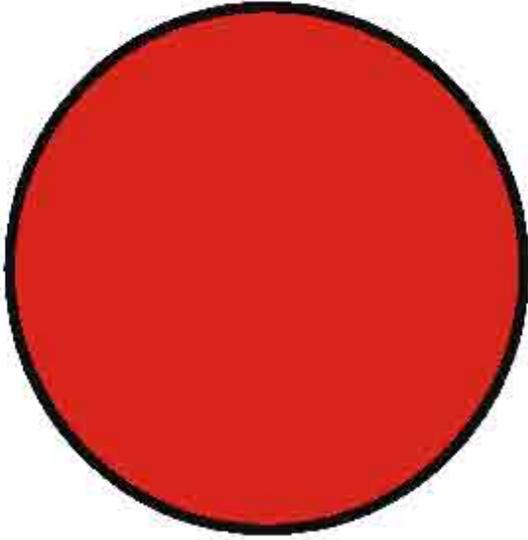

4. The lens is a transparent structure that focuses light onto the retina.

5. The retina is the light-sensitive layer at the back of the eye that converts light into electrical signals.

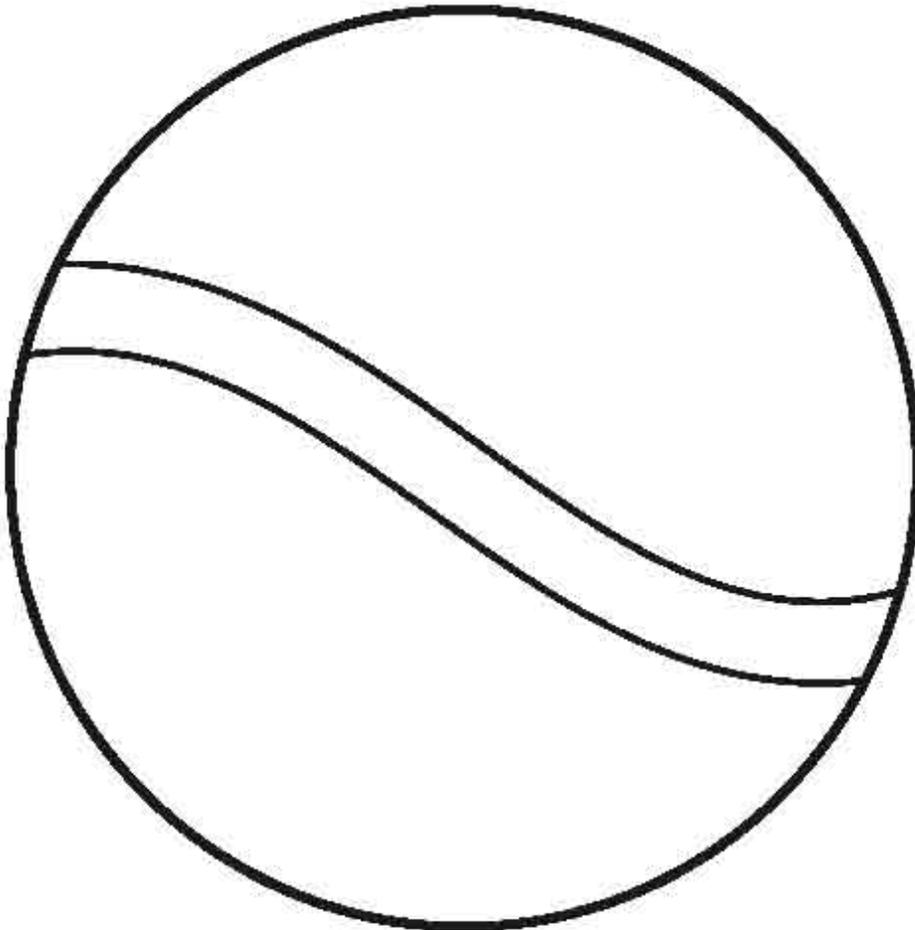

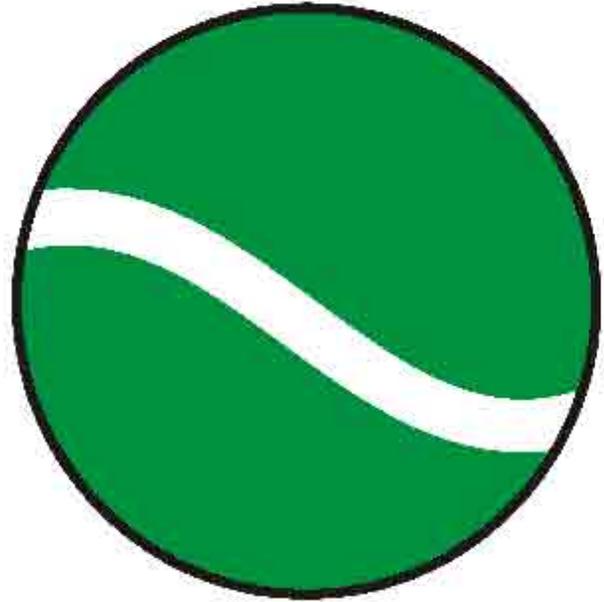

6. The optic nerve carries these signals from the retina to the brain.

7. The vitreous humor is the clear, jelly-like substance that fills the eye and helps maintain its shape.
